Problem Write a vignette in LaTeX or MathJax explaining how to use the logistic loss with non-uniform weights to get the binomial loss function in xgboost.

Answer - Logistic loss is used when y = -1,1 and binomial loss or cross entropy or log loss function refers to cross entropy or log loss where y =0,1. Logistic loss is as below:-

$$logisticloss = \frac{-\sum_{i=1}^{n} 2 * ln(1 + e^{-y_i * \hat{y_i}})}{n} \tag{1}$$

where as

$$binomialloss = -\frac{ylog(\hat{y}) + (1 - y)log(1 - \hat{y})}{n} \tag{2}$$

We can adjust it by factor of 2 to get the logistic loss.
